

#### **OIL FORMATION FOUND**

A test well being drilled on the Mrs. Melcher place near Fedor, has developed some very interesting oil formation. At 80 ft. a very black formation was encountered, showing it to be permeated with Hydrocarbon. Immediately below this formation a green sand, (Glanconite) filled with fossile, at 96 feet the drill encountered an iron pyrate rock. The odor from the crude oil was very strong at this depth. These formations show to be in the marine beds, and are strong indications of paying oil at less than 1000 ft.
